

Mini Biographies

- *Maarten van Reeuwijk*: is a Professor of Urban Fluid Mechanics at Imperial College London. Maarten's research interests center on transport processes in fluids, with a particular focus on wall-bounded turbulence and buoyancy effects. His work spans various applications, including pollution dispersion, urban heat islands and microclimates in urban areas; atmospheric flows such as convection and clouds; building ventilation involving stratified environments, plumes, jets, and exchange flows; and oceanographic and coastal processes.
